Calibration types	
CalReady, 1-port	Each FieldFox has a highly accurate calibration at the test port, at room temperature, traceable to national standards labs.
QuickCal, 1-port	Uses internal and a subset of external standards. QuickCal is most accurate for DUTs with 7/16 and Type-N connectors and measurement uncertainties are provided for frequencies ≤ 18 GHz. Reduced accuracy for DUTs with 3.5 mm (m), SMA (m), or other male coaxial connectors; performance is unspecified. QuickCal is not recommended for DUTs with 3.5 mm (f), SMA (f), or other similar female connectors. QuickCal is not applicable to waveguide.
SOL, 1-port	Traditional short, open and load 1-port calibration for reflection measurements.
Frequency response	Simultaneous magnitude and phase correction of frequency response errors for either reflection or transmission measurements.
Enhanced response (also known as one-path, two-port)	Corrects for frequency response and source match for transmission measurements, and reflection frequency response, directivity and source match for reflection measurements. Partial correction for load match for low-loss reciprocal devices.
CalReady, 2-port	Full 12-term error correction at test port, at room temperature. Highly accurate calibration, traceable to national standards labs.
QuickCal, 2-port	Full 12-term error correction using internal and a subset of external standards. QuickCal is most accurate for DUTs with 7/16 and Type-N connectors and measurement uncertainties are provided for frequencies ≤ 18 GHz. Reduced accuracy for DUTs with 3.5 mm (m), SMA (m), or other male coaxial connectors; performance is unspecified. QuickCal is not recommended for DUTs with 3.5 mm (f), SMA (f), or other similar female connectors. QuickCal is not applicable to waveguide.
SOLT or offset short, 2-port	Traditional short, open, load and thru (or using offset short standards) for calibration. Full 12-term error correction.
QSOLT calibration, 2-port	Full 12-term error correction. Requires fewer connections, compared to traditional SOLT (4 compared to 7). Applicable to insertable devices.
Unknown thru calibration, 2-port	Full 12-term error correction. Applicable to both insertable and non-insertable devices. Easily characterize non-insertable devices such as Type-N to 3.5 mm, or female-female devices with unknown thru calibration.
Guided calibration wizard	FieldFox's calibration wizard recommends a calibration type and calibration kit based on selected parameters and connector types. Alternatively, users can select their own calibration type and calibration kit.
Interpolated error correction	With any type of accuracy enhancement applied, interpolated mode recalculates the error coefficients when the test frequencies are changed. The number of points can be increased or decreased and the start/stop frequencies can be changed, but the resulting frequency span must be a subset of the original calibration frequency span.
Connectors	Type-N 50 ohm, Type-N 75 ohm, 7/16, TNC, 3.5 mm, 2.4 mm, waveguide bands: X-band WR-90, P-band WR-62, K-band WR-42 Custom coaxial or waveguide calibration kits can be added to any FieldFox analyzer.

Time domain

The performance listed in this section applies to the time domain capabilities available in the following models:

FieldFox microwave combination analyzers: **N9913A, N9914A, N9915A, N9916A, N9917A, N9918A**
FieldFox microwave vector network analyzers: **N9925A, N9926A, N9927A, N9928A**

In time-domain mode, FieldFox computes the inverse Fourier transform of the frequency-domain data to display reflection or transmission coefficients versus time.

Setup parameters

- Time: start, stop, center, span
- Gating: start, stop, center, span, and on/off
- Number of points, velocity factor, line loss, window shape, independent control for all four traces

Time stimulus modes	
Low-pass step	Low-pass step is similar to a traditional time domain reflectometer (TDR) stimulus waveform. It is used to measure low-pass devices. The frequency-domain data should extend from DC (extrapolated value) to a higher value.
Low-pass impulse	Low-pass impulse response is used to measure low-pass devices.
Bandpass impulse	The bandpass impulse simulates a pulsed RF signal and is used to measure the time domain response of band-limited devices.
Windows The windowing function can be used to filter the frequency domain data and thereby reduce overshoot and ringing in the time domain response.	
Windows	Minimum, medium and maximum, manual entry of Kaiser Beta and impulse width.
Gating The gating function can be used to selectively remove reflection or transmission time domain responses. In converting back to the frequency domain the effects of the responses outside the gate are removed. The results can be viewed with gating on and off, using two traces.	
Gate types	Notch, bandpass
Gate shapes	Maximum, wide, normal, minimum

See **FieldFox Configuration Guide** for option information. Many capabilities listed in this Data Sheet require options.

Vector voltmeter (VVM)

The performance listed in this section applies to the VVM capabilities available in the following models:

FieldFox microwave combination analyzers: **N9913A, N9914A, N9915A, N9916A, N9917A, N9918A**
FieldFox microwave vector network analyzers: **N9925A, N9926A, N9927A, N9928A**

With vector voltmeter mode, you can characterize the difference between two measurements easily. The zeroing function allows you to create a reference signal, and characterize the difference between two device measurements. The results are shown on a large display in digital format.

Tracking generator or independent source

The specifications in this section apply to the tracking generator or independent source capabilities available in the following models:

FieldFox microwave combination analyzers: **N9913A, N9914A, N9915A, N9916A, N9917A, N9918A**.
FieldFox microwave spectrum analyzers: **N9935A, N9936A, N9937A, N9938A**.

Interference analyzer and spectrogram

The capabilities listed in this section apply to the interference analyzer capabilities available in the following models:

FieldFox microwave combination analyzers: **N9913A, N9914A, N9915A, N9916A, N9917A, N9918A**
FieldFox microwave spectrum analyzers: **N9935A, N9936A, N9937A, N9938A**

Markers	Time, delta time
Trace playback and recording	Record all spectrum analyzer measurements Store data internally or on USB or SD card Playback recorded data using FieldFox Frequency mask trigger allows recording to occur upon trigger

See **FieldFox Configuration Guide** for option information. Many capabilities listed in this Data Sheet require options.

Spectrum analyzer time gating

The capabilities listed in this section apply to the time gating features available in the following models:

FieldFox microwave combination analyzers: **N9913A, N9914A, N9915A, N9916A, N9917A, N9918A**
FieldFox microwave spectrum analyzers: **N9935A, N9936A, N9937A, N9938A**

With time gating, you can measure the spectrum of a periodic signal during a specified time interval. Pulsed-RF signals are an example of a periodic signal that can be measured with time gating. For example, you can measure the pulse during the on period, not the transition or the off period. Or you can exclude interfering signals such as a periodic transient. Time gating allows you to view spectral components that would otherwise be hidden. FieldFox's time gating method is a Gated FFT.

Gate method	Gated FFT
Span range	Any span
RBW range	1 Hz to 300 kHz (derived from gate width)
Gate delay range	-150 ms to 10 s
Gate width (length) range	6 µs to 1.8 s
Gate sources	External, RF burst, Video

Reflection measurements (RL, VSWR)

The capabilities listed in this section apply to the reflection measurements in the following models:

FieldFox microwave spectrum analyzers: **N9935A, N9936A, N9937A, N9938A**

Models	Reflection measurements
N9935A	30 kHz to 9 GHz
N9936A	30 kHz to 14 GHz
N9937A	30 kHz to 18 GHz
N9938A	30 kHz to 26.5 GHz

Measurements: Return loss, VSWR
Normalization using data/memory

Radio standards

With a radio standard applied, pre-defined frequency bands, channel numbers or uplink / downlink selections can be used instead of manual frequency entry. The pre-defined FieldFox radio standards include bands such as W-CDMA, LTE, and GSM. Alternately, users can create custom standards and import them into FieldFox analyzers.

See **FieldFox Configuration Guide** for option information. Many capabilities listed in this Data Sheet require options.

The specifications in the sections that follow apply to these FieldFox analyzers:

FieldFox microwave combination analyzers: **N9913A, N9914A, N9915A, N9916A, N9917A, N9918A**
FieldFox microwave vector network analyzers: **N9925A, N9926A, N9927A, N9928A**
FieldFox microwave spectrum analyzers: **N9935A, N9936A, N9937A, N9938A**

Built-in power meter

Using the built-in power meter, FieldFox is able to make very accurate channel power measurements. The channel bandwidth can be set wide to simulate average power meter measurements. This measurement function provides the flexibility to make user definable channel power measurements.

Setup parameters: Center frequency, including selection of radio standards and channel selection, span or channel width
Functions: Relative/absolute measurements, offsets, units of dBm or watts, or dB or %, minimum and maximum limits

Remote control capability

Option 030 adds remote *control* capability to FieldFox analyzers, so that FieldFox can be controlled via an iOS device. The FieldFox app, running on the iOS device, combined with Option 030 on the FieldFox analyzer provides full control of the instrument from a remote location. The app emulates the front panel of FieldFox, so users can press the FieldFox hardkeys or softkeys using their iPhone or iPad, and make measurements remotely.

For example, a tower climber can be on the tower with a FieldFox analyzer, while the technician controls and makes the measurements down below, using an iPad. The iPad and FieldFox communicate via a network connection.

iOS device requirements
- *iPad*, *iPhone*, or *iPod Touch*
- iOS of 5.1 or higher
- A WiFi or 3G/4G connection

The FieldFox app communicates with FieldFox via a network connection, so both the iOS device and FieldFox need to be on a network where both devices can reach the other. For example, a company intranet or a site installation using a wireless router. FieldFox can directly be connected to a LAN cable, or if wired LAN is not available, a user supplied wireless router can be configured to work with FieldFox. FieldFox does not include a wireless router.

FieldFox app without Option 030

The FieldFox app can be installed on an iOS device independent of the presence of Option 030 on the analyzer. Without Option 030, users can *view* the live display screen of their FieldFox remotely, but cannot *control* the instrument. With 030 purchased and installed on their FieldFox, users can both *view* and *control* their FieldFox. Control refers to the ability to press hardkeys, softkeys, make or change measurements, etc.

Option 030 does not include the iOS device itself. Users must supply their own iOS device. Option 030 is a license on the FieldFox analyzer.

Option 030 and the FieldFox app are not applicable to Android, BlackBerry, or Windows phone/tablet devices.

See **FieldFox Configuration Guide** for option information. Many capabilities listed in this Data Sheet require options.
